Here’s what you may experience

A SKIN REACTION FROM AN INTRADERMAL FLU SHOT CAN BE EXPECTED

A visible reaction on your skin where your flu shot was injected is very common.

You may see one of these reactions:

Example 1: Bump with no redness
Example 2: Redness without a bump
Example 3: Redness with a bump

Illustrations are for visual reference only. Injection-site reactions can vary for each patient.

These reactions may not be what you’ve experienced before when getting a flu shot. Although the reactions may be different, the effectiveness of an intradermal flu shot is similar to that of a typical flu shot.¹

You might experience a raised bump, redness, swelling, and sometimes pain and itching where the vaccine was injected. These reactions are typically not serious and generally resolve on their own in 3 to 7 days.²

HOW IS AN INTRADERMAL FLU SHOT DIFFERENT?

• Intradermal vaccines are injected into the skin using a small, ultra-thin microneedle¹,³-⁵
• Typical vaccine needles go through the skin, then a layer of fat, and then into the muscle

For more information about Fluzone Intradermal vaccine and what to expect when vaccinated, please speak to your health care professional.

IMPORTANT SAFETY INFORMATION

INDICATION
Fluzone Intradermal vaccine is given to people 18 through 64 years of age to help prevent influenza disease caused by influenza A and B strains contained in the vaccine.

SAFETY INFORMATION
Redness, firmness, swelling, and itching at the injection site occur more frequently with Fluzone Intradermal vaccine than with Fluzone vaccine. Other common side effects to Fluzone Intradermal vaccine include pain at the injection site; headache, muscle aches, and fatigue. Other side effects may occur. Fluzone Intradermal vaccine should not be administered to anyone with a severe allergic reaction (eg, anaphylaxis) to any vaccine component, including eggs, egg products, or to a previous dose of any influenza vaccine.

Tell the doctor if you have ever experienced Guillain-Barré syndrome (severe muscle weakness) after a previous dose of influenza vaccine. If you notice any other problems or symptoms following vaccination, please contact your health care professional immediately. Vaccination with Fluzone Intradermal vaccine may not protect all individuals.

For more information about Fluzone Intradermal vaccine, talk to your health care professional and click here to see complete Patient Information.

You are encouraged to report negative side effects of prescription drugs to the FDA. Visit www.fda.gov/medwatch or call 1-800-FDA-1088.

Fluzone Intradermal vaccine is manufactured and distributed by Sanofi Pasteur Inc.
